

Report of the current state of the project - Project Manager TM

Software engineering (12/06/2017)

María Luz Mosteiro

Changes:

- Only owner can add and remove.
- A new window is opened to delete properties or users, there the user(Owner) has to chose one property or user to delete and then click on the Delete button. If success, then the window is closed.

Requirements not fulfilled implemented:

- Windows to modify property and user created, but not linked yet.
- Windows to link or unlink administrator to properties are created but not linked yet.
- The template to display items from lists created but not fully linked yet.
- The objects created via the GUI use a limited number of fields with testing purposes(Property or User).
- The interface to create or modify properties or users is not yet fully developed, optional fields are missing.
- An SQL database was not implemented. Static storage is used instead for testing.
- There is even inconsistency in the GUI style, it is not responsive, inconsistency in sizes and colors. Many of the elements are not located where they should be.
- The current "Use manual" is not consisten with the current version of the software.

In general, we could say that these points are consequence of :

- The linear sequential model for the development of the project.
- The size of the team, 3 persons instead of the planned 4.
- Ignorance by part of the team of the handling of tools for the control of versions.
- As consequence, the implementation in different projects and the union of the work via "Copy&paste".
- Ignorance by part of the team of paradigm of the object oriented programming.
